Sequence 858, Application US/09732210

Patent No. 6573361

GRNERAL INFORMATION:

APPLICANT: Bunkers, Greg J.

APPLICANT: Mittanck, Cindy A.

APPLICANT: Way Younie S.

TITLE OF INVENTION: Anti-fungal Proteins and Methods for Their Use

FILE REFERENCE: 38-21(15.036)B

CURRENT APPLICATION NUMBER: US/09/732,210

CURRENT PILING DATE: 2000-12-07

PRIOR PAPLICATION NUMBER: US 60/169,513

PRIOR FILING DATE: 1999-12-07

PRIOR FILING DATE: 1999-12-07

PRIOR FILING DATE: 1999-12-07

NUMBER OF SEQ ID NOS: 1753

SEQ ID NO 858

LENGTH: 158

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 2, Application US/07814220

Patent No. 5925540

GENERAL INFORMATION:

APPLICANT: Caccet, Thomas

APPLICANT: Toth, Thomas E.

APPLICANT: Szumanski, Maria B.W.

TITLE OF INVENTION: SYNTHETIC ANTIFREEZE PEPTIDE AND

TITLE OF INVENTION: SYNTHETIC GENE CODING FOR ITS PRODUCTION

NUMBER OF SEQUENCES: 43

CORRESPONDENCE ADDRESS:

ADDRESSE: WHITHAM, CURTIS & WHITHAM

STREET: Reston Intl. Center, 11800 Sunrise Valley Dr.,

STREET: Suite 900

i Sequence 23624, Application US/09252991A

i Sequence 23624, Application US/09252991A

i Patent No. 6551795

i GENERAL INFORMATION:

ITILE OF INVENTION: MCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

ITILE OF INVENTION: MCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

ITILE OF INVENTION: MCHEIC ACID AND AMINO ACID SEQUENCES

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NOS: 33142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GENERAL INCORDATION:
APPLICANT: MARC J. RUDEHIGELD et al.
APPLICANT: MARC J. RUDEHIC ACID AND ANINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: ARCIGICA AND THERAPEUTICS
TITLE OF INVENTION: ARCIGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE REFERENCE: 107196,136

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is that of a peptide comprising amino acid residues 6-25 of the glucan binding protein-B (GbpB) of Streptococcus mutans strain SK13 ADD91649. The peptide binds to a major histocompatibility complex (MHC) class II protein. It was identified as a potential B cell epitope using a matrix-based algorithm for epitope prediction, which was used to search the primary amino acid sequence of GbpB for known MHC class II binding motifs. The peptide can be used in immunogenic compositions and subunit vaccines for dental caries. These comprise MHC class II protein-binding GbpB peptides covalently linked with peptide subunits (preferably from the catalytic domain) of a glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Diepitopic or multiepitopic polypeptides can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Glucan binding protein-B; GbpB; vaccine; anticaries; epitope; immunogen.

                                                                      ö
                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB-derived peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MfC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                          Gaps
prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present sequence is the protein sequence of the glucan binding protein. B (GDpB) of Streptococcus mutans strain SK32. The sequence includes a number of human leucocyte antigen (HLA)-binding epitopes. The invention provides immunogenic compositions and vaccines for dental caries. The compositions comprise major histocompatibility complex (WHC) class II protein-binding GbpB peptides, especially HLA-binding peptides, cowplently linked with peptide subunits of a glucosyltransferase. The antibody in a mammal. Dispitopic or multiepitopic polypeptides can be prepared synthetically or by recombinant bNA technology. Antibodies
                                                  Composition useful as vaccines for dental caries comprises a fragmefit of a glucan binding protein-B binding to a major histocompatibility complex class II protein.

```
The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunogenicity; immune stimulation; glucan binding protein-B;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising a fragment of a glucan binding protein-B (dpbB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to a computational method (MI) for identifying adhesin and adhesin-like proteins, by computing the sequence-based attributes of protein sequences using five attribute modules of a neural network software, training an artificial neural network software, training an artificial neural network software, training an artificial neural network (PRM) for each of the computed five attributes, and identifying the adhesin and adhesin and adhesin-like proteins as set of 274 annotated genes concoding adhesin and adhesin-like proteins, having 274 fully defined 162-concoding adhesin and adhesin-like proteins, having 105 hypothetical defined 306-18876 base pairs (SEQ ID NO: 385-58) sequences; a set of 105 hypothetical defined 306-18876 base pairs (SEQ ID NO: 1279); a set of 105 hypothetical adhesin and adhesin-like proteins, having 105 fully defined 53-3716 base pair (SEQ ID NO: 1-279); a set of 105 hypothetical adhesin and adhesin-like proteins, having 105 fully defined 106-5291 base pair (SEQ ID NO: 289-384) sequences; and a fully connected multilayer feed forward ANN (I) based on (MI). (MI) is useful for identifying and short-liketing proteins for further testing in development of new vaccine formulations concerns for identifying putative adhesins pathogenic organisms. (MI) is useful for identifying putative adhesins that are important in development of agastic ulcer and urinary tract infections. (MI) identifies adhesins from distantly related organisms, and from bacteria belonging to a wide continuacy proteins. (MI) is capable of predicting adhesive nature of phylogenetic spectrum. (MI) is capable of predicting adhesive nature of the phylogenetic spectrum. (MI) is capable of predicting adhesive nature of continuacy in the present sequence is a microbial pathogen adhesin
    Computational method for identifying adhesin and adhesin like molecules, comprises computing sequence-based attributes of protein sequences using neural network software and training an artificial neural network.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Glucan binding protein-B; GbpB; vaccine; anticaries; epitope; immunogen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 algorithm; adhesin; pharmaceutical; vaccine; drug screening; boodecella pertussis infection; antibacterial; pneumonia; antiinflammatory; respiratory-gen.; gastric ulcer; antiulcer; gastrointestinal-gen.; urinary tract infection; antimicrobial; uropathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a composition comprising a fragment of a glucan binding protein-B (GppB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                   New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present sequence is the protein sequence of the glucan binding protein—B (GbpB) of Streptococcus mutans strain 38N1. The sequence includes a number of human leucocyte antigen (HLA)-binding epitopes. The invention provides immunogenic compositions and vaccines for dental caries. The compositions comprise major histocompatibilty complex (MHC) class II protein-binding GbpB peptides, especially HLA-binding peptides, covalently linked with peptide subunits of a glucosyltransferase. The antibody in a mammal. Dispitopic or multipeltopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing
           Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                ö

The present sequence is the protein sequence of the glucan binding protein-B (GbpB) of Streptococcus mutans strain 15JP2. The sequence includes a number of human leucocyte antigen (HLA)-binding epitopes. The includes a number of numunogenic compositions and vaccines for dental caries. The compositions comprise major histocompatibility complex (MHC) class II protein-binding GbpB peptides, especially HLA-binding peptides, covalently linked with peptide subunits of a glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multiplicpic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in
The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.

```
The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus progenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory cativity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and activity antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity
                                     Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antihflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing

This invention describes a novel nucleic acid molecule encoding a hyperimmune serum reactive antigen or its fragment from Streptococcus pyogenes. The nucleic acid molecule or hyperimmune serum-reactive antigen or its fragment are useful for the manufacture of a pharmaceutical preparation, especially a vaccine, against S. pyogenes infection. In addition, the hyperimmune serum reactive antigen or fragment is used for the isolation and/or purification and/or identification of an interaction partner of the hyperimmune serum reactive antigen or its fragment, for the generation of a peptide (e.g. anticalines) binding to the antigen or it fragment, or for the manufacture of a functional nucleic acid selected from aptamers and spiegelmers. The nucleic acid molecule may also be used for the manufacture of functional ribonucleic acids, such as ribozymes, pyogenes hyperimmune serum reactive antigens, fragments and the encoding polynucleotide described in the invention.
                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid molecules encoding hyperimmune serum-reactive antigens from Streptococcus pyogenes, useful for diagnosing, preventing and treating S. pyogenes infections.
                                                                                                                                                                                                                                                       Winkler B, Gelbmann D;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 2, Application US/08186222

Patent No. 5559007

GENERAL INFORMATION:
APPLICANT: Schmitz, Albert
TITLE OF INVENTION: Bacterial Vectors
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSER: CIBA-GEIGY Corporation
STREET: 7 Skyline Drive
CITY: Hawthorne
STATE: New York
COUNTRY: USA
ZTATE: New York
COUNTRY: USA
ZTATE: HO532

COMPUTER EADABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: Batentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
RILING NATE: RECENTIN RELEASE
COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk
COMPUTER: EN PC compatible

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 655, Application US/09732210

Patent No. 6573361

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Bunkers, Greg J.
APPLICANT: Mitanck, Cindy A.
APPLICANT: Mitanck, Cindy A.
APPLICANT: Wu, Yonnie S.
TITLE OF INVENTION: Anti-fungal Proteins and Methods for Their Use PILE REFERENCE: 39-21 (15036) B
CURRENT APPLICATION NUMBER: US/09/732,210
CURRENT FILING DATE: 2000-12-07
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
